

Lab: Installing the Environment

Environment

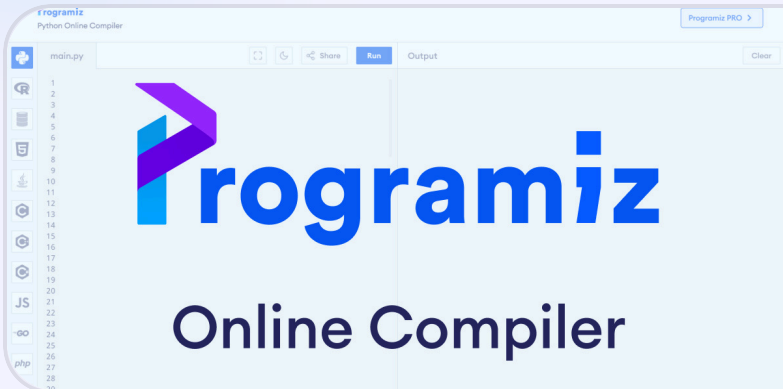

There are **three ways** you can write and run C programs:

1. Mobile Application

If you don't have a computer, you can install **Cxxdroid** (Android) or **Dcoder** (Android & iOS). These apps let you write, compile, and run C code directly on your phone.

2. Online C Compiler

You can also use a website to write and execute C code without installing anything.

 www.programiz.com

Online C Compiler – Programiz

Write and run your C programming code using our online compiler. Enjoy additional features like code sharing, dark mode, and support for multiple...

3. Install an IDE (Code::Blocks)

We will use this method in our course. Code::Blocks is a free and powerful IDE for writing, building, and running C programs.

Installation of Code Blocks

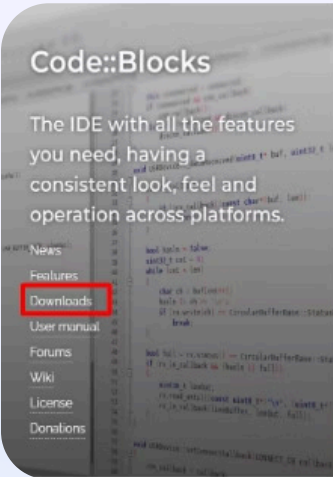

If you have any confusion, you can watch this youtube video : <https://youtu.be/S9NhsWepfOM?si=L-eCC5DIqcTr5CJQ>

Code::Blocks

Code::Blocks

The free C/C++ and Fortran IDE.

Code::Blocks is a free C/C++ and Fortran IDE built to meet the most demanding needs of its users. It is designed to be very extensible and fully configurable.

Built around a plugin framework, Code::Blocks can be extended with plugins. Any kind of functionality can be added by installing/coding a plugin. For instance, event compiling and debugging functionality is provided by plugins!

If you're new here, you can read the [user manual](#) or visit the [Wiki](#) for documentation. And don't forget to visit and join our [forums](#) to find help or general discussion about Code::Blocks.

We hope you enjoy using Code::Blocks!

Code::Blocks / Downloads

Downloads

There are different ways to download and install Code::Blocks on your computer:

- Download the binary release**
- Download a nightly build
- Download the source code

If you feel comfortable building applications from source, then this is the recommend way to download Code::Blocks. Downloading the source code and building it yourself puts you in great control and also makes it easier for you to update to newer versions or, even better, create patches for bugs you may find and contribute them back to the community on sourceforge.

You can choose either **SourceForge.net** (recommended, it's faster) or **AppCDN** to download Code::Blocks.

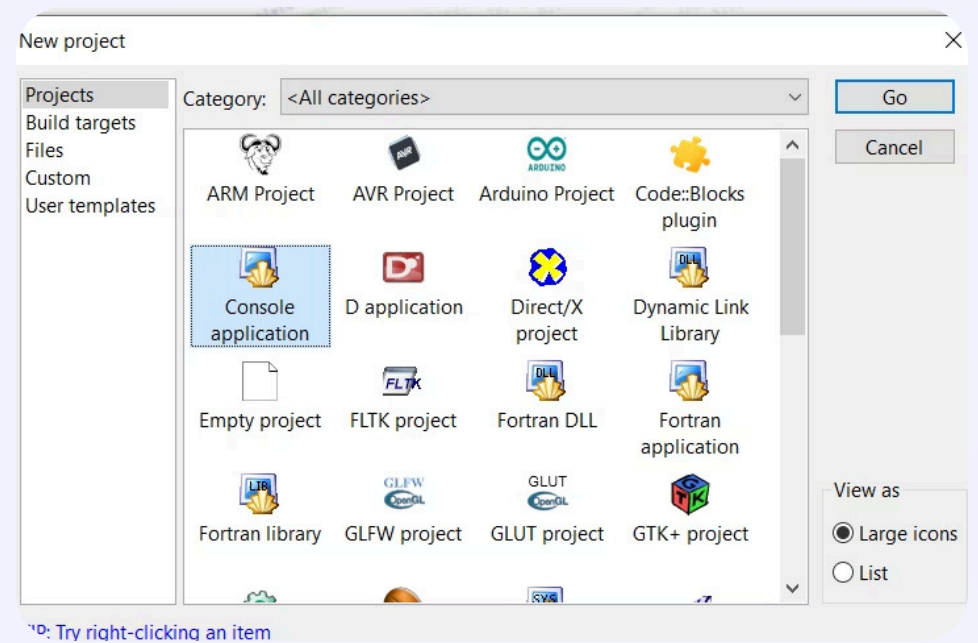

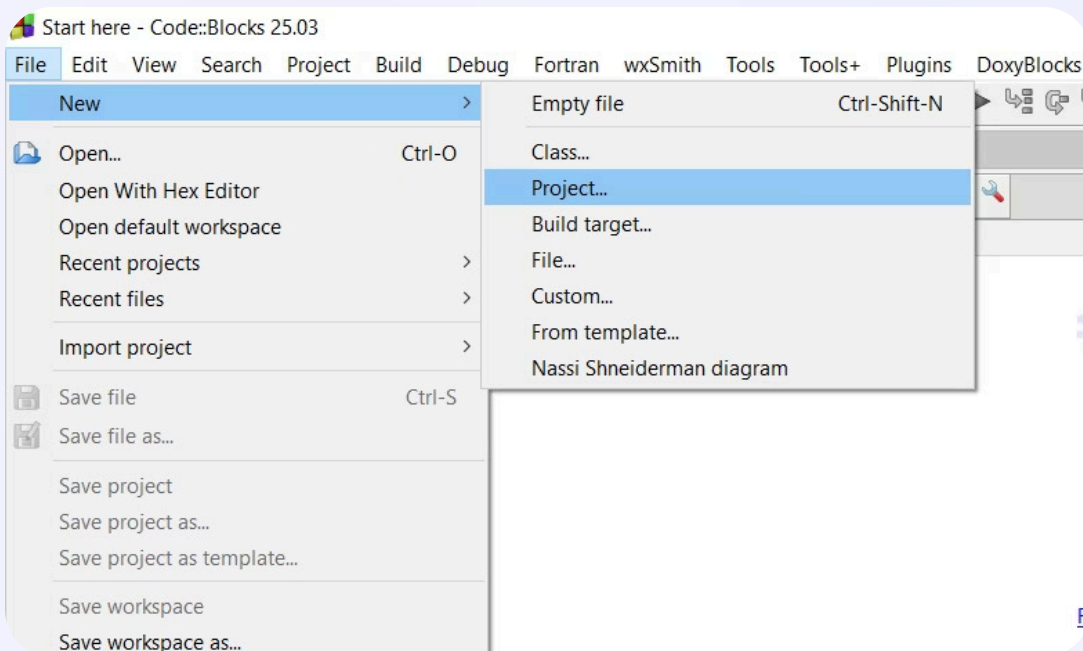

Microsoft Windows (64 bit, default)

File	Download from
codeblocks-25.03-setup.exe	Sourceforge.net or dAppCDN.com
codeblocks-25.03-setup-nonadmin.exe	Sourceforge.net or dAppCDN.com
codeblocks-25.03-nosetup.zip	Sourceforge.net or dAppCDN.com
codeblocks-25.03mingw-setup.exe	Sourceforge.net or dAppCDN.com
codeblocks-25.03mingw-nosetup.zip	Sourceforge.net or dAppCDN.com

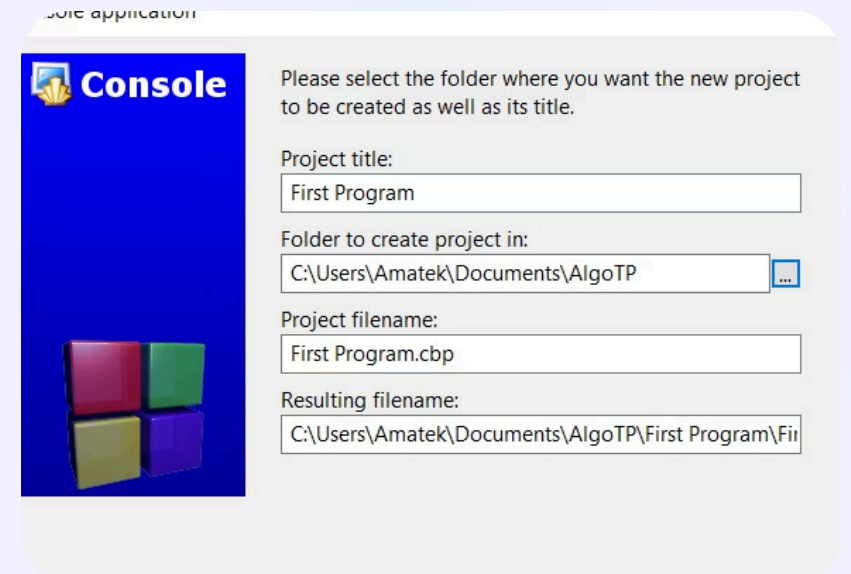

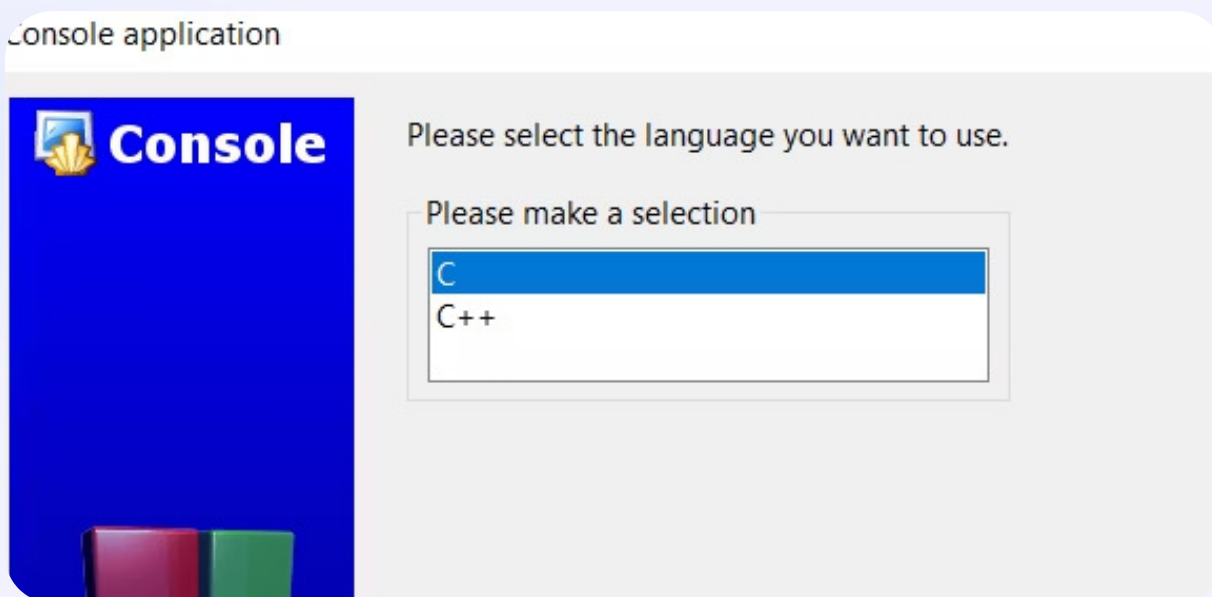

NOTE: The codeblocks-25.03-setup.exe file includes Code::Blocks with all plugins. The codeblocks-25.03-setup-nonadmin.exe file is provided for convenience to users that do not have administrator rights on their machine(s).

First Program

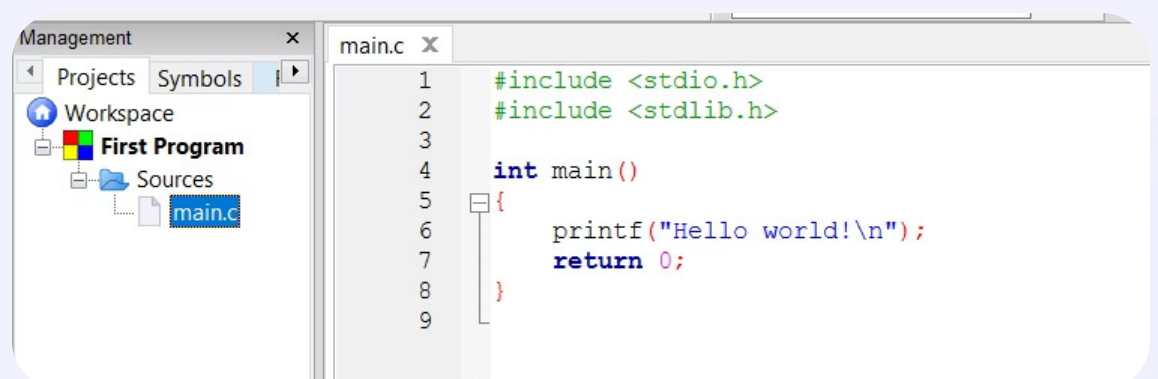

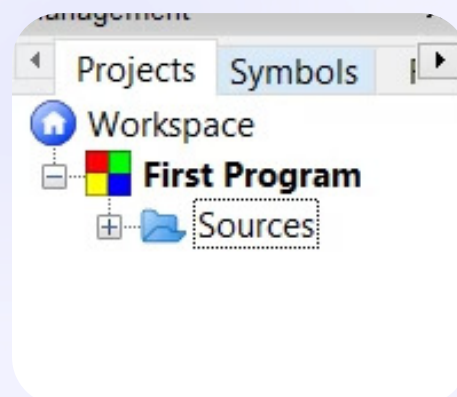

After choosing "**Console application**", click on "**Next**" until the first window appears; then choose the "**C**" option.

Give a title to your project and select a folder to create it in.

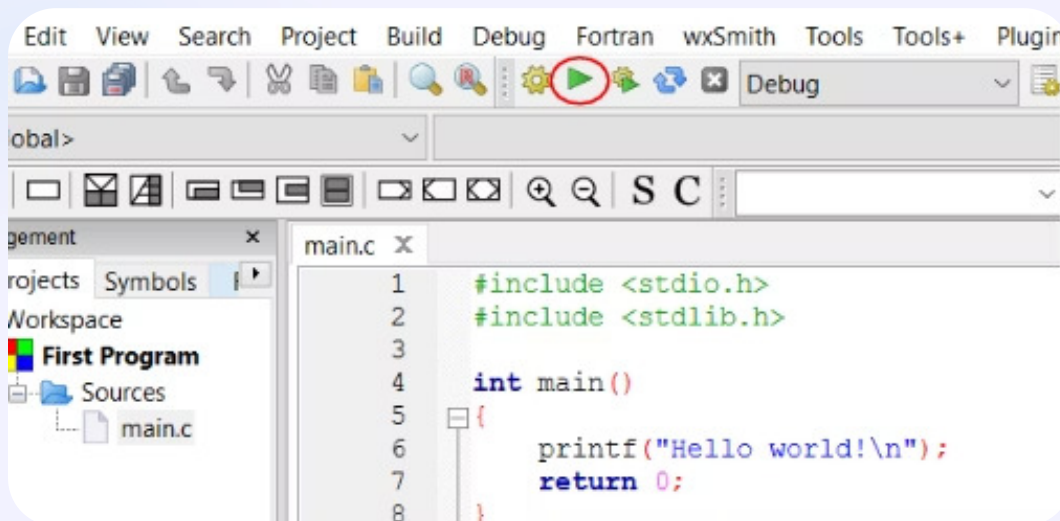

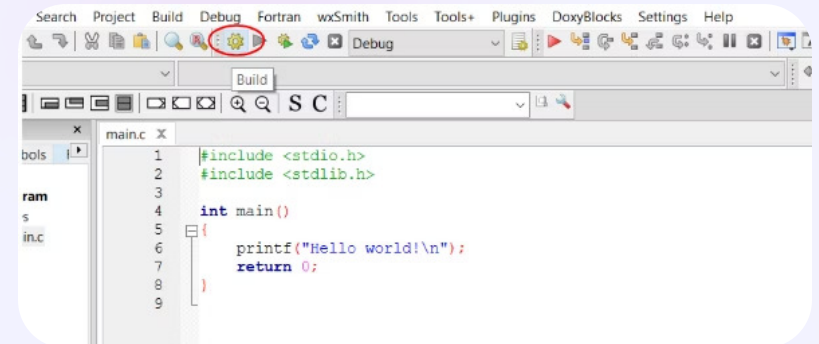

After this, your project is already created. Click on the (+) next to **Sources**; the file "**main.c**" will appear, which contains the source code.

Compiling & Executing code

🔧 What "Build" does in Code::Blocks:

- It **checks your code** for errors (syntax errors, missing semicolons, etc.).
- It **compiles the source code** into machine language that the computer can understand.
- It **creates an executable file (.exe)** if there are no errors.
- It **shows errors and warnings** in the bottom panel if something is wrong.
- It **prepares your program** to be run using the "Run" button.

Hello world!

Process returned 0 (0x0) execution time : 1.147 s
Press any key to continue.

What the "Run" button does in Code::Blocks

- It **starts (executes)** your program.
- It **opens the console window** where you can see your program's output.
- If your program needs input (like asking the user to type something), you can **enter it in that console**.
- It **doesn't recompile** your code — it just runs the last version you built.
- If you changed your code, you must click **"Build and Run"** to see the new version.
